MUZNI MAZNAVI

SOFTWARE ENGINEER

Colombo, Sri Lanka | +94 75 875 8538 | muznimaznavi00@gmail.com | GitHub | Portfolio | LinkedIn

Software engineering professional with industry experience and a strong sense of ownership across the full development lifecycle. I bring a disciplined, risk-aware approach to building and maintaining production systems and a genuine commitment to delivering reliable, high-quality software within collaborative engineering teams.

PROFESSIONAL EXPERIENCE

HCL Technologies | Colombo, Sri Lanka

SOFTWARE ENGINEER **October, 2025 - Present**

- Architected a full Permission-Based Access Control system, migrating the platform from role-based permissions to per-page granular checks across multiple modules, with contextual disabled-state UI for unauthorized users.
- Designed and implemented a comprehensive User Management module with complex role/permission logic in C#, earning direct client recognition for improving administrative efficiency.
- Prepared release handover documentation and deployment packages for multiple major production releases, coordinating with the application support team to ensure smooth handoffs with zero critical post-release defects.

ASSOCIATE SOFTWARE ENGINEER **April, 2023 - October, 2025**

- Designed the Master Group Industry Classification module end-to-end, including a classification derivation algorithm based on best-rated Legal Entities by rank, manual override support, and full audit logging.
- Developed and maintained the Counterparty management module, including bulk Excel/CSV upload with pre-import validation covering duplicate ID detection, mandatory field checks, and row-level error reporting, and delivered iterative UI and functional enhancements in response to client change requests.
- Diagnosed and resolved critical production bugs where entities were silently excluded from Master Group Ratings due to a missing entry, delivering a minimal, production-safe fix.
- Built bulk permission assignment scripts for user groups, incorporating duplicate-prevention logic, regional GUID handling, and transaction rollback with preview modes.
- Conducted Knowledge Transfer sessions to onboard new team members, covering platform architecture, codebase conventions, and development workflows.

INTERN SOFTWARE ENGINEER **January, 2022 - April 2023**

- Authored transactional database scripts with preview modes, rollback capabilities, and soft-deletion patterns, maintaining data integrity across tens of thousands of production records.
- Executed manual test cases across credit risk and counterparty management modules, identifying and documenting defects in collaboration with the development team.
- Reproduced and investigated production-reported issues, providing root cause analysis to accelerate developer resolution.
- Supported UAT cycles by validating business logic against client requirements and raising discrepancies through the defect tracking workflow.

Tech Stack: C#, .NET Framework, ASP.NET WebForms, ASP.NET WebAPI, MSSQL, T-SQL, GitLab

---

EDUCATION

BACHELOR OF SCIENCE (HONS) IN COMPUTER SCIENCE | SECOND CLASS UPPER HONOURS
Informatics Institute of Technology, affiliated with the University of Westminster, UK

PROJECTS

DEVTRACK: LAYERED SPRINT & TASK TRACKING SYSTEM

A full-stack ASP.NET Core MVC application for sprint and task management, built with a layered architecture to gain production-level hands-on experience with .NET Core, EF Core, and modern authentication patterns.

- Architected a four-layer solution (Core, Infrastructure, Application, Web) with zero-dependency domain entities, keeping business logic fully testable and independent of the data access layer.
- Implemented the Repository and Service layer patterns with dependency injection, enforcing business rules such as sprint-lifecycle validation at the service level rather than in controllers.
- Designed and integrated ASP.NET Core Identity with a separate authentication database, role-based authorization (Admin/TeamMember), and policy-based access control for destructive operations.
- Built a custom visual design system and responsive UI that reflect the application's domain model (work item status states) rather than a default theme.

Technologies: C#, ASP.NET Core MVC, Entity Framework Core, SQL Server, ASP.NET Core Identity

SINMOOD: EMOTIONAL DISTRESS DETECTION IN SINGLISH SOCIAL MEDIA

A machine learning system for detecting emotional distress patterns in Singlish social media content and providing personalized digital detox recommendations. Deployed as an interactive web application on HuggingFace Spaces.

- Developed and trained a multi-class emotion classification model using CalibratedLinearSVC with XLM-RoBERTa embeddings for Singlish text.
- Built an end-to-end web interface with real-time sentiment analysis, distress level visualization, and personalized wellness recommendations.
- Deployed the application on HuggingFace Spaces with privacy-focused, client-side processing principles.

Technologies: Python, scikit-learn, Transformers (HuggingFace), Streamlit

RECYCHAMP: RECYCLING CHALLENGE MOBILE APPLICATION

A cross-platform mobile application encouraging environmental sustainability through gamified recycling challenges, badge rewards, and community participation.

- Developed core challenge discovery, submission, and badge reward features in a collaborative team.
- Implemented state management using Flutter Bloc for complex application data flow.

Technologies: Flutter, Firebase, flutter bloc

OTHER PROJECTS: PROJECTS

TECHNICAL SKILLS

- Languages: C#, Java, Python, Kotlin, Dart, T-SQL
- Web Development: ASP.NET Core MVC, ASP.NET Core Web API, Entity Framework Core, HTML, CSS, JavaScript
- Mobile APP Development: Android Native (Kotlin, Jetpack Compose), Flutter
- Frameworks & Concepts: .NET Core, .NET Framework, ASP.NET WebForms, ASP.NET Core Identity, Repository Pattern, Dependency Injection, RESTful APIs
- Databases: MSSQL, SQLite, MongoDB, Firebase
- Tools & Platforms: GitHub, GitLab, Jira, Azure
